

This project is an excellent example of a full-stack application designed to demonstrate the integration of various technologies. The **static** and **templates** folders are dedicated to the front-end, providing the JavaScript and HTML files that form the user interface. The **app.py** file is the main Python script responsible for the backend operations, including handling API logic. Note that the application requires a connection to a MongoDB database, so you'll need to have MongoDB set up and running to use it effectively.

For more details and to explore the code, you can check out the repository here:
